## WIDER APPLICATION

### Why Use Nested PCR?

Nested PCR is a modification of a polymerase chain reaction technique intended to reduce PCR product contamination due to the amplification of non-specific primer binding sites.

### Why Use Long PCR?

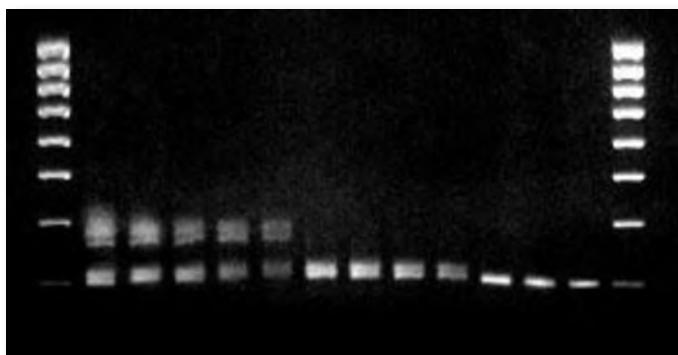

Long PCR, a new technique based on ordinary PCR, applied to amplify the PCR template longer than 5 Kb.

### Why Use Touchdown PCR?

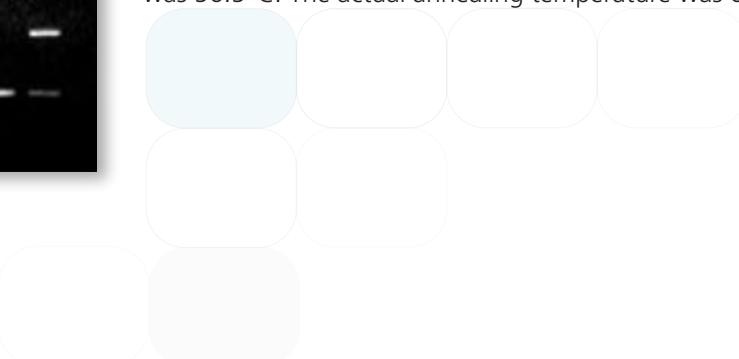

Touchdown PCR is a method of polymerase chain reaction by which primers avoid amplifying non-specific sequences. The annealing temperature during a polymerase chain reaction determines the specificity of primer annealing. The melting point of the primer sets the upper limit on annealing temperature. At temperatures just below this point, only very specific base pairing between the primer and the template occurs.

### End Point Analysis Result

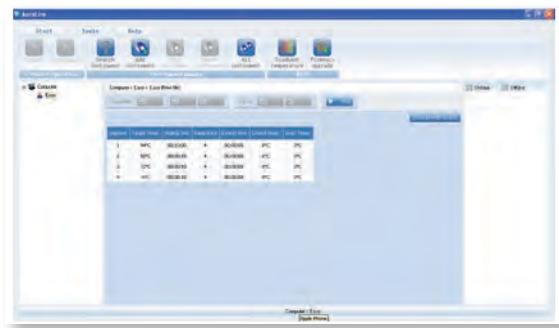

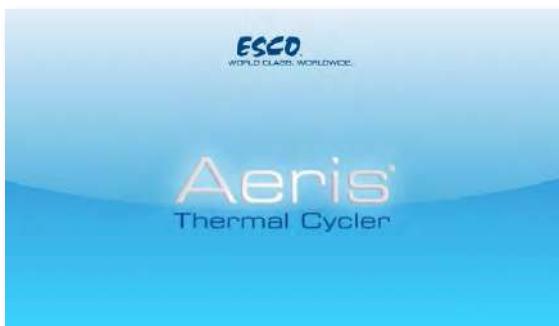

The best conditions are found in Well 10, where the temperature was 63.2°C.

**Note:** Experimental determination of optimal annealing temperature. The calculated primer annealing temperature was 56.5°C. The actual annealing temperature was 63.2°C.
